SwiftLog Logistics Limited: Executive Business Intelligence Report

Prepared by Yawa Jacqueline GBEDEVI,

Junior Data Analyst, AnalystLab Africa Consulting.

Week 5 assignment, 18 October 2026.

1. Executive summary

Between 1 January and 8 September 2026, SwiftLog processed 5,000 orders from 1,000 customers. The total order value is 21.67 million, but only 7.11 million (about 33%) has been realised through delivered orders. The rest sits in orders that were cancelled (32.5% of all orders) or are still pending.

Delivery is the weakest area. Under SwiftLog's own rule, a shipment is delayed once it runs 3 days late or more, and on that basis 63.7% of the 5,000 shipments were delayed. The average delay is 3.57 days. Late delivery is also the most frequent reason customers give to return an order, so a logistics problem translates directly into lost revenue.

Demand itself looks healthy. No single customer, product or city dominates revenue, and monthly volumes stay between 577 and 654 orders. SwiftLog does not have a demand problem. It loses value after the order is placed.

Three priorities come out of the analysis: reduce cancellations, fix on-time delivery, and rebalance inventory. Section 5 gives eleven recommendations; each tied to evidence from the dashboard.

2. Scope, data and method

The analysis uses the 11 SwiftLog datasets: customers, orders, order items, products, suppliers, warehouses, inventory, shipments, delivery performance, employees and returns. The data was cleaned and transformed into Power Query, modelled as a star schema in Power BI, and measured with a set of DAX measures. The report has five dashboard pages: Executive, Shipment and Delivery, Customer Analytics, Inventory and Warehouse, and Supplier and Product. Monetary values are shown in the currency units of the source data, which does not state the currency.

The following business rules were adopted and applied consistently across all pages.

Rule	Definition
Realised revenue	Quantity multiplied by unit price, for orders with status Delivered only
Delayed shipment	3 or more days of delay, matching the Status field of the delivery performance table. On time means 0 to 2 days
Return rate	Total returns divided by total orders
Inventory	Each of the 4,000 inventory records is treated as a separate stock record and summed

Rule	Definition
Region	The location of the warehouse the shipment left from

Several inconsistencies in the source data were detected, kept in the model and flagged rather than deleted.

Finding	Size	Treatment
Shipments exist for orders that were cancelled or are pending	3,342 of 5,000 shipments	Kept, order status slicer added to every page
Returns recorded on orders that were never delivered	335 of 500 returns	Kept, counted by a dedicated data quality measure
Inventory repeats the same warehouse and product pair	4,000 records for 2,455 distinct pairs	Kept as separate stock records
No supplier key in products or shipments	All 150 suppliers	Supplier performance could not be measured
No delivery date and no warehouse capacity	Whole dataset	Delay days and a stock-based proxy used instead

3. KPI summary

KPI	Value	Reading
Realised revenue	7.11M	About one third of order value
Gross order value	21.67M	All orders, any status
Total orders	5,000	
Total customers	1,000	991 placed at least one order
Average order value	About 4,290	Delivered orders only
Cancellation rate	32.52%	Needs immediate attention
On-time delivery rate	36.28%	Needs immediate attention
Average delivery delay	3.57 days	Above the 2-day tolerance
Return rate	10.00%	500 returns
Inventory stock level	1,007,764 units	5,038.82 units per employee
Products and suppliers	250 and 150	

4. Key findings

4.1 Which products generate the highest revenue?

Revenue is spread across 250 products and three categories, with Fashion first, followed by Food and Electronics. The ten leaders are P203, P085, P229, P006, P159, P220, P156, P217, P025 and P118, and together they bring in 700,107, just under 10% of realised revenue. P203 comes first with 85,978 from 189 units, followed by P085 (83,844) and P229 (79,261). The unit prices of these leaders' range between 415 and 495. Since no product dominates, losing any one item would hurt little, but there is also no single hero product to build around.

4.2 Which customers contribute the highest revenue?

C0223 leads with 57,592, then C0773 with 52,252 and C0599 with 40,996. The top ten customers add up to 359,173, only about 5% of realised revenue, against an average of 7,172 per customer. Revenue is also even across cities: Kano 1.9M, Lagos 1.8M, Ibadan 1.8M and Abuja 1.7M, with about 250 customers in each. Customers place 5.05 orders on average and the distribution peaks near 5, so almost everyone is a repeat buyer. That makes repeat purchase a weak way to tell customers apart in this data.

4.3 Which warehouses operate most efficiently?

Using the on-time delivery rate as the efficiency measure, W10 in Kano (40.1%) and W01 in Abuja (about 41%) come out on top among the warehouses reviewed. W05 in Lagos (about 32%) and W03 in Abuja (about 33%) are at the bottom, and W03 also has the most delayed shipments (232). The whole range is narrow, roughly 32% to 41% against a network average of 36.3%, so no warehouse performs well in absolute terms. The utilisation figure is a relative proxy (stock compared with the largest warehouse), because capacity data does not exist.

4.4 Which suppliers consistently perform well?

This cannot be answered. None of the tables link a supplier to a product or a shipment, so a supplier score would have to be invented. Recommendation 8 explains how to fix this at the source.

4.5 Which products have the highest return rates?

Across the business, 10% of orders are returned (500 returns). Late Delivery is the most frequent reason, ahead of Wrong Item and Damaged. At product level, P040 has the most returns with 14, followed by P086 and P231 with 12 each, then seven products with 11 each (P020, P071, P108, P109, P130, P177 and P201). A return is linked to an order, not to a product, so a product-level count credits the return to every product on that order. These are counts, not rates, and they are useful for comparison only. The gap between the first product (14) and the tenth (11) is small, so the data does not single out a problem product.

4.6 Which regions experience the most delayed deliveries?

Lagos has the most delayed shipments in absolute terms, around 1,700 of the 3,186 (about 53%), followed by Abuja with about 850 and Kano with about 650. This mostly reflects volume. Delayed counts per warehouse are very similar, between 200 and 232, and on-time rates by city sit within a couple of points of each other. Delays are a network-wide problem, not a regional one.

4.7 Which months record peak business activity?

August is the peak with 654 orders, followed by April (638) and May (612). February is the lowest full month with 577. Across January to August the average is about 606 orders a month and no month moves more than 8% away from it, so there is no strong seasonality. September shows 154 orders only because the data stops on 8 September.

4.8 Which KPIs require immediate management attention?

Four of them. The cancellation rate (32.52%) and the on-time delivery rate (36.28%) are the most urgent. Realised revenue is only a third of order value, which follows from the cancellations and pending orders. The return rate of 10% matters mainly because its leading cause is late delivery. Stock turnover, from 0.024 to 0.029 depending on category, is also very low.

4.9 What operational inefficiencies were identified?

- Two thirds of order value never become revenue, because orders are cancelled or stay pending.
- Delays are systemic: 63.7% of shipments, with an average delay above SwiftLog's own tolerance.
- Shipments are created for orders that were cancelled or are pending (3,342 of 5,000).
- 335 of 500 returns concern orders that were never delivered, which points to a recording or system integration problem.
- Stocks are large (over one million units) and turn very slowly, yet 380 warehouse and product records fall under the low stock threshold. At network level no product is short, since the lowest holds 1,439 units. The issue is distribution, not total quantity.

4.10 What business opportunities should SwiftLog pursue?

The largest one is recovering in value already generated: pending and cancelled orders together represent 14.56M of order value. Even a modest improvement in conversion would be worth more than most growth projects. Ibadan is a second opportunity, since it brings in 1.8M in revenue although SwiftLog has warehouses only in Abuja, Kano and Lagos. Finally, the strongest accounts (C0223, C0773) and the top-selling products offer room for targeted account management and promotion.

5. Recommendations

#	Area	Recommendation	Dashboard evidence
1	Delivery optimisation	Set a network on-time target (for example 60% within two quarters) and review the list of late shipments every week	63.7% of shipments delayed, average delay 3.57 days
2	Logistics optimisation	Audit dispatch and carrier handover, starting with the five warehouses with the most delays (W03, W05, W04, W07, W09)	224 to 232 delayed shipments each, spread evenly across cities
3	Revenue protection	Record a cancellation reason on every order, review the main causes monthly, and confirm stock before accepting an order	32.52% of orders cancelled, 1,626 orders

#	Area	Recommendation	Dashboard evidence
4	Operational cost reduction	Stop creating shipments for orders that are cancelled or pending	3,342 shipments linked to undelivered orders
5	Return reduction	Warn and compensate customers when a shipment passes the 2-day tolerance, and add a picking check for wrong items	Late Delivery is the first return reason, Wrong Item the second
6	Inventory management	Rebalance stock between warehouses, set reorder points per warehouse and product, and review slow-moving stock	380 low-stock records despite over 1M units, turnover of 0.024 to 0.029
7	Warehouse efficiency	Share the practices of W01 and W10 with W05 and W03, and track on-time rate by warehouse every week	About 41% at W01 against about 32% at W05
8	Supplier improvement	Add a SupplierID to products and shipments, then build a supplier scorecard (on-time rate, defects, returns)	None of the 150 suppliers can be assessed today
9	Customer retention	Assign account managers to the largest accounts and track repeat purchase by customer	C0223 and C0773 each exceed 50,000, against an average of 7,172
10	Business growth	Test a dispatch point or partner for Ibadan	Ibadan brings 1.8M in revenue with no local warehouse
11	Performance monitoring	Use the dashboard in a weekly review with five KPIs (cancellation rate, on-time rate, return rate, realised revenue, low-stock records) and agreed thresholds	These five KPIs show the largest gaps

6. Expected business impact

The figures below are illustrative scenarios, not forecasts. Recovering 5 points of cancellation rate would mean about 250 additional orders. At the current average delivered order value of about 4,290, that is roughly 1.07M of extra realised revenue, around 15% more than today. Raising the on-time rate would reduce returns that are caused by late delivery, and removing shipments created for undelivered orders would cut transport and handling costs. A supplier scorecard and rebalanced stock would improve planning, although their value cannot be sized with the current data.

7. Limitations

The data ends on 8 September 2026, so September is incomplete. The inconsistencies between order status, shipments and returns suggest a recording or integration problem that should be fixed at the

source before any figure is used for a decision. Several indicators are proxies: delay days stand in for delivery time, warehouse utilisation is relative to the largest warehouse, and turnover is based on units because no cost data exists. The inventory records have no dates, so they may not describe a single point in time. Supplier performance could not be assessed at all.

8. Conclusion

SwiftLog's customers keep coming back and its sales are steady. The weak points are operational: a third of orders are cancelled, nearly two thirds of shipments arrive late, and stock is large but badly placed. These problems are fixable and measurable, and the dashboard built for this project gives management a way to track progress every week. The first step is to agree on the targets in Section 5 and to correct the data capture issues listed in Section 2.
